Catecholamines 1922 -1971 H. BLASCHKO  
Adrenaline and related substances were discussed in the 1924 edition of Hefl'ter's Handbook by PAUL TRENDELENBURG. On 164 pages

he described what was then known not only of adrenaline and its closest relatives but also of the sympathomimetic compounds such as tyramine and ephedrine. When the present Editors of the Handbook entrusted us with the task of editing the present Volume it was decided to restrict it to adrenaline and the other naturally occurring catecholamines. The sympathomimetic amines in general will be discussed only in their relation to the catecholamines. Since TRENDELENBURG completed his review this field has undergone an enormous expansion. There has been a wealth of new findings, and a succession of new

ideas. The new theories that have been built into contemporary thought will be fully discussed in the succeeding contributions. But many of the hypotheses that have been put forward since 1924 have long been discarded and yet, they have often led to important observations that we still consider as valid.

observations that we still consider as valid.

Not much more than a decade has passed since the appearance of the outstanding handbook, Catecholamines, edited by BLASCHKO and MUSCHOLL, in the series: Handbook of Experimental Pharmacology. However, this extremely well organized volume dealt mainly with the origin, molecular actions, and fate of the naturally occurring catecholamines. It was felt that a separate volume should be dedicated to the remarkable and exciting

progress made in the field of agents influencing the adrenergic system, both in physiologic and pharmacologic respect. The editor of the present volume considers himself lucky to have been able to persuade a number of eminent specialists to collaborate. The main concept of the present handbook is a systematic approach to the various effects of adrenergic activators and inhibitors starting with the chemistry and structure activity relationship, followed by the evaluation of adrenergic activators and inhibitors, and discussing their mode of action. The most voluminous part is the chapter dealing with

the systemic pharmacology of these agents analyzing the effects on the central nervous system, on the autonomic nervous system, on the cardiovascular, the respiratory, the digestive, the endocrine system, on the skeletal muscle, and on metabolism. Kinetics and biotransformation, further toxic effects are discussed in the following chapters. A special chapter on clinical features concludes the monograph.

The Handbook of Endocrinology. This extensive two-volume text provides an impressive breadth and depth of coverage difficult to find in other sources. After a broad survey of the functions of major endocrine glands, the book launches into detailed reviews of both established and hot, new research areas. Selected topics include:
