During Routine monitoring visits I come across a lot of clinical research coordinators (CRC) that would like to take the leap and become clinical research associates (CRAs). They have been in clinical research for a long time and know the ropes, yet, they are afraid to submit an application. Some have tried and have been rejected; others are just too scared to try. Then there are life science degree holders, RNs, research nurses and international medical graduates (IMGs) all with strong credentials, but do not know how or where to start with their application for CRA jobs. Some are rejected because from their resumes it doesn't appear that they have any experience. This is a big issue because Contract research organizations (CROs) employ individuals with some kind of clinical research experience, and if you don't convey your expertise in research during interviews then the likelihood of you getting the job starts to diminish. JP Holdasham's desire is to share his experiences with others and help hardworking and interested individuals navigate the rewarding but sometimes difficult application process to becoming a CRA. In his new book, "CRA Jobs For Science Degree Holders, RNs and IMGs: - A guide to six figure Clinical research associate income in clinical research monitoring; he provides a "How to guide," to becoming a CRA, for both entry level applicants and experienced CRAs that want to navigate to six figures in income as clinical research associates. He starts off talking about the history behind clinical research as it is today; he talks about the core duties of a research monitor and what to do when you go on monitoring visits. From there he guides you on how to secure a Clinical research associate job. It covers how to put your resume together, how to create and tap into a network of people to guide you get a leg in the door. When you are new to clinical research he provides in the book avenues to get the experience you need for free. How to write your resume and the layout it should follow is also well described in this book. A lot of people that get invited for interviews get derailed at the interview stage; JP has laid out how to handle interviews, both phone interview and face to face interviews. The types of questions to expect during interviews, and how to respond to them precisely and successfully. Most problems have a solution; it is just knowing where to look to find the answers. If you want to get into the lucrative and interesting field of clinical research monitoring; make a contribution to finding new cures for diseases and new devices to aid the sick - then this is the book for you.

This book is an easy-to-follow handbook that introduces readers to entry-level clinical job opportunities and explains how to qualify for them, with a particular emphasis on how to gain clinical experience that a hiring manager will accept. Each chapter covers one of the clinical specialties involved in conducting pharmaceutical clinical trials: for example, clinical research associate, clinical data manager, biostatistician, and clinical drug safety specialist. The chapters are written as personalized narratives, allowing the reader to follow the daily work of a clinical specialist as he or she supports a clinical study and interacts with the other study team members. The descriptions of these specialists are composite profiles that incorporate the true-to-life experiences of typical clinical study team members. A list of career options available to workers after mastering their entry-level clinical position, as well as a tool box for those seeking a position, are included. Career Opportunities in Clinical Drug Research also gives readers a brief overview of research and development in the pharmaceutical industry and explains how a typical clinical study is conducted.

This classic reference, now updated with the newest applications and results, addresses the fundamentals of such trials based on sound scientific methodology, statistical principles, and years of accumulated experience by the three authors.

The field of computer science (CS) is currently experiencing a surge in undergraduate degree production and course enrollments, which is straining program resources at many institutions and causing concern among faculty and administrators about how best to respond to the rapidly growing demand. There is also significant interest about what this growth will mean for the future of CS programs, the role of computer science in academic institutions, the field as a whole, and U.S. society more broadly. Assessing and Responding to the Growth of Computer Science Undergraduate Enrollments seeks to provide a better understanding of the current trends in computing enrollments in the context of past trends. It examines drivers of the current enrollment surge, relationships between the surge and current and potential gains in diversity in the field, and the potential impacts of responses to the increased demand for computing in higher education, and it considers the likely effects of those responses on students, faculty, and institutions. This report provides recommendations for what institutions of higher education, government agencies, and the private sector can do to respond to the surge and plan for a strong and sustainable future for the field of CS in general, the health of the institutions of higher education, and the prosperity of the nation.

Computer Science: The Hardware, Software and Heart of It focuses on the deeper aspects of the two recognized subdivisions of Computer Science, Software and Hardware. These subdivisions are shown to be closely interrelated as a result of the stored-program concept. Computer Science: The Hardware, Software and Heart of It includes certain classical theoretical computer science topics such as Unsolvability (e.g. the halting problem) and Undecidability (e.g. Godel's incompleteness theorem) that treat problems that exist under the Church-Turing thesis of computation. These problem topics explain inherent limits lying at the heart of software, and in effect define boundaries beyond which computer science professionals cannot go beyond. Newer topics such as Cloud Computing are also covered in this book. After a survey of traditional programming languages (e.g. Fortran and C++), a new kind of computer Programming for parallel/distributed computing is presented using the message-passing paradigm which is at the heart of large clusters of computers. This leads to descriptions of current hardware platforms for large-scale computing, such as clusters of as many as one thousand which are the new generation of supercomputers. This also leads to a consideration of future quantum computers and a possible escape from the Church-Turing thesis to a new computation paradigm. The book's historical context is especially helpful during this, the centenary of Turing's birth. Alan Turing is widely regarded as the father of Computer Science, since many concepts in both the hardware and software of Computer Science can be traced to his pioneering research. Turing was a multi-faceted mathematician-engineer and was able to work on both concrete and abstract levels. This book shows how these two seemingly disparate aspects of Computer Science are intimately related. Further, the book treats the theoretical side of Computer Science as well, which also derives from Turing's research. Computer Science: The Hardware, Software and Heart of It is designed as a professional book for practitioners and researchers working in the related fields of Quantum Computing, Cloud Computing, Computer Networking, as well as non-scientist readers. Advanced-level and undergraduate students concentrating on computer science, engineering and mathematics will also find this book useful.

New Scientist magazine was launched in 1956 "for all those men and women who are interested in scientific discovery, and in its industrial, commercial and social consequences". The brand's mission is no different today - for its consumers, New Scientist reports, explores and interprets the results of human endeavour set in the context of society and culture.
