Galileo's Leaning Tower ...

Galileo was under house arrest while he was working on his model of gravity, so going to the leaning tower of Pisa was not likely. The experiments he performed involved rolling balls down a slope. They would be going slower than free fall, so air resistance would make much less difference.

When the scientist Galileo befriends a bright farm boy, Massimo, the two begin to investigate the science of motion, in a tale that shows that anyone can be a scientist with a little curiosity, determination, and imagination. Jr Lib Guild.
Simultaneous.

Publisher description

A suspenseful narrative and spiritive rendition of the life of Galileo.

Is science beautiful? Yes, argues acclaimed philosopher and historian of science Robert P. Crease in this engaging exploration of history's most

Access Free Galileos Leaning Tower Experiment

beautiful experiments. The result is an engrossing journey through nearly 2,500 years of scientific innovation. Along the way, we encounter glimpses into the personalities and creative thinking of some of the field's most interesting figures. We see the first measurement of the earth's circumference, accomplished in the third century B.C. by Eratosthenes using sticks, shadows, and simple geometry. We visit Foucault's mesmerizing pendulum, a cannonball suspended from the dome of the Panthéon in Paris that allows us to see the rotation of the earth on its axis. We meet Galileo—the only scientist with two experiments in the top ten—brilliantly drawing on his musical training to measure the speed of falling bodies. And we travel to the quantum world, in the most beautiful experiment

of all. We also learn why these ten experiments exert such a powerful hold on our imaginations. From the ancient world to cutting-edge physics, these ten exhilarating moments reveal something fundamental about the world, pulling us out of confusion and revealing nature's elegance. The Prism and the Pendulum brings us face-to-face with the wonder of science.

Dialogue Concerning the Two New Sciences was a 1632 bestselling book by Galileo Galilei which discussed the Copernican system and the traditional Ptolemaic system of the universe. In 1633, Galileo was convicted of heresy because of the book. It was placed on the Index of Forbidden Books after his conviction.

A guide for parents and teachers on the material third grade-age children should be learning, including such subjects as literature, language arts, history and geography, music, math, and science.

In Korea in the early 1800s, news from the countryside reached the king by means of signal fires. On one mountaintop after another, a fire was lit when all was well. If the king did not see a fire, that meant trouble, and he would send out his army. Linda Sue Park's first picture book for Clarion is about Sang-hee, son of the village firekeeper. When his father is unable to light the fire one night, young Sang-hee must take his place. Sang-hee knows how important it is for the fire to be lit-but he wishes that he could see

soldiers . . . just once. Mountains, firelight and shadow, and Sunhee's struggle with a hard choice are rendered in radiant paintings, which tell their own story of a turning point in a child's life.

The essays in this volume (except for the contribution of Dr. Le Grand) are extremely revised versions of papers originally delivered at a workshop on Galileo held in Blacksburg, Virginia in October, 1975. The meeting was organized by Professor Joseph Pitt and sponsored by the Department of Philosophy and Religion, The College of Arts and Sciences, and the Division of Research of Virginia Polytechnic Institute and State University. The papers that follow deal with problems of Galileo's philosophy of science, specific and general problems

Access Free Galileos Leaning Tower Experiment

connected with his methodology, and with historical and conceptual questions concerning the relationship of his work to that of contemporaries and both earlier and later scientists. New perspectives take many forms. In this book the 'newness' has, for the most part, two forms. First, in the papers by Wisan, Shea, Le Grand and Wallace (the concerns will also appear in some of the other contributions), greatly enriched historical discoveries of how Galileo's science and its methodology developed are provided. It should be stressed that these papers are attempts to recapture a deep sense of the kind of science Galileo was creating. Other papers in the volume, for example, those by McMullin, Machamer, Butts and Pitt, underscore the importance of this historical venture by discussing

Access Free Galileos Leaning Tower Experiment

various aspects of the philosophical background of Galileo's thought. The historical and philosophical evaluations and analyses compliment one another.

Galileo was an Italian mathematician, astronomer, and physicist. He is also noted for being the first to study the skies with a refracting telescope. In one year - 1610 - he made major discoveries relating to the moon, Milky Way, Jupiter's four large moons, sunspots, and the phases of Venus.
