Manufacturing's central role in global innovation Companies compete on the decisions they make. For years—even decades—in response to intensifying global competition, companies decided to outsource their manufacturing operations in order to reduce costs. But we are now seeing the alarming long-term effect of those choices: in many cases, once manufacturing capabilities go away, so does much of the ability to innovate and compete. Manufacturing, it turns out, really matters in an innovation-driven economy. In Producing Prosperity, Harvard Business School professors Gary Pisano and Willy Shih show the disastrous consequences of years of poor sourcing decisions and underinvestment in manufacturing capabilities. They reveal how today's undervalued manufacturing operations often hold the seeds of tomorrow's innovative new products, arguing that companies must reinvest in new product and process development in the US industrial sector. Only by reviving this industrial commons can the world's largest economy build the expertise and manufacturing muscle to regain competitive advantage. America needs a manufacturing renaissance—for restoring itself, and for the global economy as a whole. This will require major changes. Pisano and Shih show how company-level choices are key to the sustained success of industries and economies, and they provide business leaders with a framework for understanding the links between manufacturing and innovation that will enable them to make better outsourcing decisions. They also detail how government must change its support of basic and applied scientific research, and promote collaboration between business and academia. For executives, policymakers, academics, and innovators alike, Producing Prosperity provides the clearest and most compelling account yet of how the American economy lost its competitive edge—and how to get it back.

Discusses why manufacturing is so important to business innovation and how poor sourcing decisions have had a detrimental effect on American business.

Twenty articles from the "Harvard Business Review" discuss manufacturing strategy, organizational requirements, performance measurements, and investments in new technology

The years since the global financial crisis have seen something of a renaissance in the manufacturing industry. The United States has launched its Advanced Manufacturing Partnership, and China owes much of its spectacular economic boom in the last decades to its being the 'world's factory'. Is there room for the EU in this landscape? This timely new book explores Europe's role in this evolving environment. It argues that on the one hand, in terms of sheer numbers, the role of the manufacturing industry in the EU is on a par with other major global economies. However, the book also states that Europe falls short of its global competitors (the USA in particular) in terms of its involvement in the most innovative manufacturing sectors. The volume therefore argues that this creates the opportunity for a new European industrial policy. Exploring the development of current EU policy, the book puts forward suggestions as to how the EU can improve in terms of the competitiveness of its technology policy. Placing the EU's position in the context of the industrial structures of the USA, Japan and the BRICs, the book blends theoretical models and practical examples in order to offer a the state of the art look at the current and future direction of Europe's industrial policy. This book will be of relevance to all those with an interest in European economics, industrial economics, public policy, European politics and European studies.

"Made in the USA" marketing makes smart business sense. U.S. manufacturers are discovering that home-grown production has increased financial benefits, especially compared to China, whose competitiveness has dimmed significantly. However, the marketing value of "Made in the USA" could well be even greater. This book is a first-hand view of this and other fascinating realities in four successful factories producing products and successfully beating back foreign competition and are prime examples of the beginnings of a Manufacturing Renaissance now taking hold in the United States. This up-front view of how things are Made in America is combined with anecdotal insights into the future of manufacturing from analysts at the Aspen Institute and the Boston Consulting Group. The bottom line: these factories, collectively employing more than five thousand workers who begin life at these companies without any specialized skills, highlight what is happening in factories all across America.

The notable rebound of U.S. manufacturing activity following the Great Recession has raised the question of whether the sector might be experiencing a renaissance. Using panel regressions, we find that a depreciating real exchange rate, an increasing spread in natural gas prices between the United States and other G-7 countries, and in particular decreasing unit labor costs have had a positive impact on U.S. manufacturing production. While we find it unlikely for manufacturing to become a main engine of growth in the United States, we find that U.S. manufacturing exports could provide nonnegligible growth opportunities going forward.

"Made in the USA" marketing makes smart business sense. U.S. manufacturers are discovering that home-grown production has increased financial benefits, especially compared to China, whose competitiveness has dimmed significantly. However, the marketing value of "Made in the USA" could well be even greater. This book is a first-hand view of this and other fascinating realities in four successful factories producing products and successfully beating back foreign competition and are prime examples of the beginnings of a Manufacturing Renaissance now taking hold in the United States. This up-front view of how things are Made in America is combined with anecdotal insights into the future of manufacturing from analysts at the Aspen Institute and the Boston Consulting Group. The bottom line: these factories, collectively employing more than five thousand workers who begin life at these companies without any specialized skills, highlight what is happening in factories all across America.

How America can rebuild its industrial landscape to sustain an innovative economy. America is the world leader in innovation, but many of the innovative ideas that are hatched in American start-ups, labs, and companies end up going abroad to reach commercial scale. Apple, the superstar of innovation, locates its production in China (yet still reaps most of its profits in the United States). When innovation does not find the capital, skills, and expertise it needs to come to market in the United States, what does it mean for economic growth and job creation? Inspired by the MIT Made in America project of the 1980s, Making in America brings experts from across MIT to focus on a critical problem for the country. MIT scientists, engineers, social scientists, and management experts visited more than 250 firms in the United States, Germany, and China. In companies across America—from big defense contractors to small machine shops and new technology start-ups—these experts tried to learn how we can rebuild the industrial landscape to sustain an innovative economy. At each stop, they asked this basic question: "When you have a new idea, how do you get it into the market?" They found gaping holes and missing pieces in the industrial ecosystem. Even in an Internet-connected world, proximity to innovation and users matters for industry. Making in America describes ways to strengthen this connection, including public-private collaborations, new government-initiated manufacturing innovation institutes, and industry/community college projects. If we can learn from these ongoing experiments in linking innovation to production, American manufacturing could have a renaissance.
